

# PIG FloodFence™ Assembly Instructions

Please read the following instructions carefully before assembling and storing your FloodFence™ system.

## Assembly Instructions:

- Inspect ground conditions and clear any debris.
- FloodFence is most effective on hard-standings.

- Each FloodFence unit's linear length when connected up is 0,91m.
- To assemble together locate the lower tongue onto the vertical spigot.

# PIG FloodFence™ Assembly Instructions

- Once the lower tongue is connected into the spigot. Lift and rotate the FloodFence unit so that the upper tongue slides into the upper clamp.

- Deploy for the required number of units.

## Assembly of Corner Units:

Inner FloodFence Corner

Outer FloodFence Corner:

- An outer corner unit is assembled by butting two inner corner units and fixing with the jointing pin.

# PIG FloodFence™ Assembly Instructions

- To assemble an outer corner, please ensure the gasket strip on the back of each corner unit is applied.

- Gaskets on both corners should be touching and in contact.

- Carefully locate and fit the 'jointing pin'. This fixes the two corner units together and ensures the gaskets are compressed.

- Push the jointing pin all the way down.

# PIG FloodFence™ Assembly Instructions

To create a connection with an in situ object such as a wall - a 'Wall connector' unit should be employed. Simply connect the unit to the end of the assembled FloodFence™ Lightweight barrier:

## Assembly Instructions:

- Place the supplied wall gasket onto the 'wall connector/s'. Make sure the gasket is on the face which is going to be in contact with the object/wall.

- Remove nylon washer and bolt 'wall connectors' to the barrier. See page 5 for bolting details.

- Place the 'wall connector' against the target object/wall and ensure the wall gasket is under firm pressure.

# PIG FloodFence™ Assembly Instructions

## Optional Assembly

- Bolting the main FloodFence units together is optional. If required, main units, when assembled, can be fixed together by using a nut and bolt. This will ensure the system cannot be easily disbanded when in the field and slightly more pressure will be applied to vertical seals.

## Required Assembly

### Corner Units:

**CORNER UNITS & METAL WALL CONNECTION UNITS  
MUST ALWAYS BE BOLTED.**

- Remove black nylon washer on spigot. When assembled - simply screw off the nut & washer and remove the black nylon washer. Re-screw nut & washer back on to spigot as far as possible. Applies more pressure on seals of the corner units.

# PIG FloodFence™ Assembly Instructions

## Disbanding FloodFence Units:

Simply follow the steps above in reverse.

## Packing/Storing Guidelines:

The system stacks neatly onto a pallet. We recommend stacking as per the photo below. Please cover well if being left outside.

## Notes:

- If the ground terrain is not adequately flat where FloodFence is deployed you may experience increased seepage/leakage. You can place ballast (like sandbags) on the leading edge to assist.
- FloodFence is a lightweight water diversion system only.
